Senior Software Engineer with 10+ years shipping products end to end across web and mobile. Specialize in full-stack web with a frontend focus, taking on backend work where a feature needs it. Led a cross-functional team of 4 engineers, working in Healthcare and Fintech Payments. Recent work spans product features on a **Next.js/TypeScript** fintech platform with **Prisma** and **PostgreSQL**, and data sync and persistence on a healthcare product.

## Experience

### Software Engineer, R&D

Mar 2025 – Aug 2026

Kensa Health (formerly SURE Universal)

- built an offline-durable delivery pipeline for patient measurements — an encrypted local out-box with idempotency keys feeding a **WebSocket** stream, with checksummed chunks and a retry/backoff loop for at-least-once delivery across network drops.
- owned the client persistence layer: **SQLite** schema with versioned append-only migrations, **SQL-Cipher** encryption at rest, and Keychain-backed key management.
- defined the cross-platform wire contract with the Android client — a canonical JSON encoder producing **SHA-256** checksums byte-identical across both platforms.
- ran the project on **spec-driven** and **test-driven development** with **agentic coding** as the primary workflow — each feature specified in writing, decomposed into independently verifiable modules, then composed once every unit was covered.

### Software Engineer

Jan 2023 – Jan 2025

Worthy (Profitable solutions for growing businesses)

Product engineer on a B2B/B2C fintech platform — a merchant dashboard and a consumer checkout and financing app — built with **Next.js**, **TypeScript** and **Prisma/PostgreSQL**.

- shipped merchant cash-out end to end, letting businesses withdraw earnings to their own bank account — bank linking, ACH transfer, and the data-model change that allowed transfers to exist independently of a sales agreement.
- closed a security gap in money movement: one-time passcodes protecting transfers and trades could be requested against any email address supplied by the client, so I rebound them to the authenticated server session.
- gave merchants visibility into financing costs with a per-installment breakdown of principal and interest, replacing one overloaded page with views tailored to each payment type.
- enforced a daily withdrawal limit and corrected available-balance reporting by deriving it from the transaction ledger instead of a third-party API call.

### Software Engineer

Jun 2022 – Nov 2022

Fluxon (Global product development company)

Built front-end features for [unite.io](https://unite.io), ex. Taki Games, a social platform — reply-to-post and reply-to-comment interaction with inline @mentions, and two landing-page sections, using **TypeScript**, **React** and **Next.js**.

### Senior iOS Engineer

Jan 2020 – Apr 2022

Life360 Inc. (Family safety through location sharing)

Led a **cross-functional team of 4 engineers**, owning requirements, sprint delivery and people management. Designed and shipped the **Lead Generation** feature delivering personalized auto insurance plans into a product at *30+ million monthly active users*.

### iOS Software Engineer

Nov 2018 – Dec 2019

BetterMe USA (Personalized holistic wellness solution)

Built two consumer wellness products from scratch and led their architecture migration to **Redux** — unidirectional data flow, centralized state, event-driven design.

### iOS Software Engineer

Oct 2015 – Sep 2018

CyberVision, Inc. (Nuvo Cares, FDA-cleared remote health monitoring platform)

Built a **real-time health monitoring** app processing live sensor data for remote patient diagnostics on an **FDA-cleared** product, and architected the device communication SDK.

## Technical Stack

**Frontend:** React, Next.js (App Router), TypeScript, JavaScript, Tailwind CSS, Emotion, Radix/shadcn.  
**Backend & data:** Node.js, Next.js server actions, PostgreSQL, Prisma ORM, Supabase, SQLite, SQL-Cipher, Firebase/Firestore.

**Integrations:** REST APIs, WebSockets (Socket.IO), OAuth, NextAuth, Plaid, Treasury Prime, React Email.

**Healthcare:** FHIR R4, HL7, LOINC, UCUM.

**Mobile:** Swift, SwiftUI, UIKit, Core Bluetooth, Redux/UDF.

**Tools:** Make, GitHub Actions, Vercel, Fastlane, SonarQube.

**AI-assisted development:** Claude Code, GitHub Copilot CLI, MCP server configuration, agent context/memory engineering.

## Education

**Master's Degree in Computer Science**

2017–2018

Igor Sikorsky Kyiv Polytechnic Institute, Biomedical Engineering Department
