Lead iOS Engineer with 10+ years on Apple platforms (iOS, macOS). Built and led mobile teams (up to 4 engineers), drove architecture across Healthcare, Fitness and IoT business domains. Engineered to FDA compliance standards in safety-critical environments. Full-stack capable (React, Next.js, PostgreSQL).

## Experience

### Lead iOS Engineer, R&D

Mar 2025 – Aug 2026

Kensa Health (formerly SURE Universal)

Sole iOS engineer on a remote patient monitoring product: owned the codebase from initial commit to TestFlight, drove planning, estimation and scope with the cross-functional team, and translated protocol specifications from third-party medical device manufacturers into delivered features.

- Integrated **3 medical devices** (thermometer, pulse oximeter, 3-lead ECG recorder) over vendor SDKs, BLE GATT and serial-over-BLE, and modelled every reading as **FHIR** observation and device data resources.
- Implemented a proprietary ECG wire protocol in Swift from the manufacturer's specification with no vendor iOS SDK — binary command/ACK messaging and a real-time streaming decoder for 3-lead ECG, unit-tested against captured hex fixtures.
- Built a reusable **Core Bluetooth** connectivity layer over a generic **GATT** profile abstraction — read, write and notify behind one device-agnostic interface, fully testable without hardware, so each new device integration reused one proven connection path.
- Built an offline-durable delivery pipeline for patient measurements: an **SQLCipher**-encrypted local outbox feeding a **WebSocket** stream with checksummed chunks and a retry/backoff loop — at-least-once delivery across network drops and reconnects.
- Restructured the project for **agent-assisted development**: decomposed it into 25 independently testable Swift package products, so each unit is verified in isolation and composed into features — 420+ cases in **Swift Testing**, static analysis on every PR.

### Senior iOS Engineer

Aug 2024 – Jan 2025

Loblaw Digital

- Designed and delivered a **new subscription system** for in-store physical products, allowing users to manage recurring orders automatically (no need to reorder manually).
- Championed the introduction of a **UseCase** domain layer within the iOS architecture, improving testability for the entire iOS eng team.

### Founding iOS Engineer | Software Engineer

Jan 2023 – Aug 2024

Wurthy (Profitable solutions for growing businesses)

- Built and delivered the MVP iOS app delivering a new C2C Buy-Now-Pay-Later experience. Designed architecture (MVVM+Coordinator) and managed a team of 3 iOS engineers.
- Sunset the iOS product after company pivot to B2B category, driving transition planning and team realignment.
- Developed a business web app (boosting sales and enabling monthly recurring revenue) and a customer web app (flexible checkout flow for buyers). Built products using **Next.js**, **React 19**, **Tailwind**, **PostgreSQL** (Supabase), **Prisma ORM**, **REST API design**.

### Senior iOS Engineer | Mobile Team Lead

Jan 2020 – Apr 2022

Life360 Inc. (Family safety through location sharing)

Promoted twice in two years (Senior I → Senior II → **Mobile Team Lead**), ending as lead of a **4-engineer Android and iOS team** working directly with the US core engineering org across timezones. Designed and led the **Lead Generation** feature delivering personalized auto insurance plans, shipped into a product at *30+ million MAU (Q1 2022)*.

### iOS Software Engineer

Nov 2018 – Dec 2019

BetterMe USA (Personalized holistic wellness solution)

Built the **Health Coaching** and **Mental Health** apps from scratch, and migrated Mental Health from VIPER to **Redux architecture**.

### iOS Software Engineer

Oct 2015 – Sep 2018

CyberVision, Inc.

Project: Nuvo: applications for pregnant women and doctor. Built iOS clients for **IoT** peripherals across **KaaIoT** agency projects on the Kaa framework, connecting over BLE and Bluetooth Classic. Developed iOS applications for an **FDA-cleared** device enabling remote nonstress tests for pregnant women to monitor real-time health indicators; architected a separate device SDK over Bluetooth Classic and supported FDA and **MF**i certification from the engineering side.

## Open Source

- **PhantomKeychain** — type-safe Swift package storing secrets behind phantom-typed Keychain keys: compile-time key/value safety, in-memory test double, distributed via SPM. Extracted from production work and open-sourced for reuse across projects.

## Technical Stack

**iOS:** Swift, SwiftUI, Swift Concurrency, Swift Testing, SPM, UIKit, GCD (libdispatch), RxSwift, XCTest, Objective-C. **App architecture:** Redux/UDF, MVVM, Coordinators, Uber RIBs, VIPER.

**Platform & data:** Core Bluetooth, BLE, MFi, Keychain, WebSockets, SQLite, SQLCipher, GRDB.

**Healthcare:** FHIR R4, HL7, LOINC, UCUM.

**Full-stack:** React, React Native, Next.js, JavaScript, TypeScript, PostgreSQL.

**Tools:** Make, Fastlane, GitHub Actions.

**AI-assisted development:** Claude Code, GitHub Copilot CLI, MCP server configuration, agent context/memory engineering.

## Education

**Master's Degree in Computer Science**

2017–2018

Igor Sikorsky Kyiv Polytechnic Institute, Biomedical Engineering Department
